

From idea to merged PR

The developer workflow, one step at a time. Each step is one Claude command run in its own fresh session, produces one artifact, and waits for your explicit approval before the next step can run. Plans execute unattended in a Claude cloud session; review and merge stay with you.

Local Claude session

Cloud Claude session

You (approve, review, merge)

GitHub repo / Project board

Where the card sits on the board

Status only moves forward, and only when something about the code changes. Labels show whose hands the item is in.

Backlog Epic and PBIs filed /work:2-epic	Backlog Work folder open, plan not approved +shaping · /work:3-intent	Ready Plan approved /work:5-plan
Working Cloud run launched /work:6-execute (local)	Reviewing · you Code PR open gh project item-edit	Done · you PR merged gh project item-edit

shaping

work folder open,

plan.md

not approved ·

decision-needed

spec approved but a §8 escalation is unticked, no code until you decide

The whole flow

Three pull requests along the way. The docs PR ratifies the requirement, the docs(work) PR lands the approved artifacts, and the code PR comes from the cloud run.

Step by step

Replace `<issue#>` with the PBI number, for example `41` . Start every step in a new session; each one reads only the artifact before it, never the conversation that wrote it.

1

Brainstorm the feature

Local

Open exploration of a topic: should this thing exist at all, and what shape could it take.

CLAUDE /work:1-brainstorm "<topic>"

SUPERPOWERS superpowers:brainstorming

READS docs/PRODUCT.md , docs/PRD.md , existing docs/brainstorming/

WRITES docs/brainstorming/<topic>.md with **Status: Draft**

GATE ■ You decide whether it should exist. If not, it stays a brainstorm and never justifies code.

BOARD No change.

GIT Its own docs PR. docs/brainstorming/ is not exempt from the standalone-docs rule.

1b

Ratify into the PRD

Local

You merge

The decision moves into the documents that own it. PBIs cite a `PRD-NNN` , so this has to land before step 2 can file anything.

CLAUDE /work:1b-ratify docs/brainstorming/<topic>.md

CLAUDE /doc-audit

WRITES A diff to docs/PRODUCT.md and docs/PRD.md with new `PRD-NNN` rows; names every file in each header's `Downstream:` line; annotates the brainstorm with where the decision now lives.

GATE ■ You approve the diff, then a standalone docs PR on `docs/<slug>` , one approving review, and you merge.

AFTER MERGE /doc-audit checks the doc set for drift the change introduced.

BOARD No change.

2

Create the epic and PBIs

● Local

● GitHub

One epic per PRD feature area, one product backlog item (PBI) per requirement, linked as sub-issues and put on the board.

CLAUDE /work:2-epic PRD-NNN..PRD-MMM

READS	docs/PRD.md §6, the requirement rows just ratified
WRITES	Epic Epic: <name> labelled epic + module; PBIs PRD-NNN: <title> (Must) labelled with the module; each PBI a sub-issue of the epic; all added to Project 17.
GATE	■ You approve every title, body and label before anything is filed. Issues are visible to the team.
BOARD	Backlog

What it runs

```
gh issue create --repo Cueserve/cs-cueviksync --title "Epic: <name>" --label epic,<module> --body "<body>"
gh issue create --repo Cueserve/cs-cueviksync --title "PRD-NNN: <title> (Must)" --label <module> --body "<body>"
gh api repos/Cueserve/cs-cueviksync/issues/<pbi#> --jq .id
gh api repos/Cueserve/cs-cueviksync/issues/<epic#>/sub_issues -F sub_issue_id=<pbi id>
gh project item-add 17 --owner Cueserve --url <issue url>
```

3

Plan: state the intent

● Local

The problem, stated before anyone proposes a solution: why now, the outcome, what is in this slice and what is deliberately out.

CLAUDE /work:3-intent <issue#>

SUPERPOWERS	superpowers:brainstorming with the questions batched
READS	The PBI issue and the PRD-NNN it cites; every constraint cited to a docs/ file
WRITES	docs/work/<NNN>-<slug>-<PRD-NNN>/intent.md and the folder README.md
GATE	■ Every open question answered or deferred with a reason. Status: Approved only on your explicit yes.
BOARD	Backlog · +shaping

4

Design: write the spec

Local · fresh session

Requirements and design in one pass, with the repo's policy applied while it is written instead of discovered in review.

CLAUDE /work:4-spec <issue#>

SKILLS	/impeccable shape for UI-bearing slices only (/impeccable craft is banned)
READS	intent.md only, then PRD, ARCHITECTURE, PROJECT-STRUCTURE §2, ENGINEERING-RULES, DESIGN-SYSTEM, and the code it touches
WRITES	spec.md : behaviour, data model and RLS, Server Actions and Zod, UI in tokens, rejected alternatives, tests, downstream doc changes, §8 approvals
GATE	■ Approved on your yes. Any unticked §8 box (migration, package, auth/RLS, service-role path) labels the issue decision-needed .
BOARD	Unchanged

5

Build: write the plan

Local · fresh session

A dependency-ordered task list a session with no memory of any of this can execute and turn into a PR.

CLAUDE /work:5-plan <issue#>

SUPERPOWERS	superpowers:test-driven-development every task's proof command must fail before the task starts
READS	spec.md and intent.md §4, then every file the spec touches
WRITES	plan.md : execution contract, waves, tasks (depends-on , files , proof), branch feat/<slug> , risks, an empty Deviations section
GATE	■ Spec approved and every §8 box ticked, then your yes on the plan.
BOARD	Ready · -shaping -decision-needed

Then land the folder on main.

Open a docs(work) PR with the approved intent.md , spec.md , plan.md ; review; you merge. The cloud session clones origin/main , so a plan that is not merged is a plan it never sees.

Execute the plan in the cloud

Local

You

Cloud

One command, two modes. Locally it checks the gates and hands you the launch line. Inside the cloud session it builds the plan and opens the PR.

CLAUDE /work:6-execute <issue#>

TERMINAL `claude --cloud "/work:6-execute <NNN>-<slug>-<PRD-NNN>"`

1 · LOCAL GATE

- On `main`, `HEAD` = `origin/main`, folder clean
- `plan.md` Approved
- Plan branch not on origin yet
- Card reads Ready
- Cloud env pinned in `.claude/settings.local.json`
- Moves the card to **Working**, prints the launch line, stops

2 · YOU LAUNCH

- Paste the line into a standalone terminal at the repo root, still on `main`
- `claude --cloud` needs an interactive terminal, so no Claude session can start it for you
- Follow the run at `claude.ai/code` or in the Claude app

3 · CLOUD RUN

- Preflight: `npm ci`, `npmx supabase start`
- Waves in parallel via `superpowers:dispatching-parallel-agents`
- A task is done when its `proof` passes
`superpowers:verification-before-completion`
- Ship gate: `lint · typecheck · format:check · test`
- Pushes `feat/<slug>`, opens the PR, reports

TESTING

Vitest runs against a local Supabase stack inside the cloud VM, never the hosted project. A PR touching `supabase/migrations/` also gets `db-replay.yml`.

WHEN BLOCKED

■ The cloud session never asks. A contradiction goes into `plan.md` §Deviations and the PR opens as a **draft** titled with what blocked. A failed ship gate also means a draft PR.

NEVER

Moves cards (the cloud can't reach Projects v2), runs `--linked` Supabase commands, pushes to `main`, force-pushes, or merges.

Step 6 up close

Who does what, in order, between your machine, the board, GitHub and the cloud session.

After the PR opens

Everything from here is yours. The agent's job ended at the PR.

1. Move the card to Reviewing.

TERMINAL

```
gh project item-edit --id <item id> --project-id
PVT_kwDOAWKwws4BgZo3 --field-id PVTSSF_lAD0AWKwws4BgZo3zhay328
--single-select-option-id ae2be21a
```

- Review it with Claude.** `/code-review <PR#>` , then the CONTRIBUTING.md self-review checklist in the PR description.
- Draft PR or a Deviation?** Open a local session with `superpowers:systematic-debugging` . Fix the plan or the code; never improvise past a wrong plan.
- Review comments.** Work through them with `superpowers:receiving-code-review` . Push first, then ask for review, because a push after approval dismisses it.
- Merge.** One approving review from someone who is not the author, every thread resolved, squash or rebase. You merge; agents never do.

6. **Migration in the PR?** `/db-migrate` after merge applies it to the linked project and regenerates types.
7. **Move the card to Done** with option id `98236657` .

Rules that hold at every step

One step, one fresh session.

A step reads only the previous artifact. If the file doesn't carry it, it doesn't exist yet.

Only you approve.

`Status: Approved` is set on your explicit yes, and the next step refuses to run on a Draft.

Every board write prompts.

Nothing reaches GitHub issues or the project without an approval click.

Main is protected.

No push to `main` , no force-push, no merge or close by an agent. A hook enforces it.

Plan wrong? Stop.

Log it in `$Deviations` and open a draft PR. A plan wrong about one thing is evidence.

Cloud limits.

No Projects v2 and no Supabase login in the cloud. Card moves and `--linked` commands run locally.

Source: `docs/work/README.md` , `CLAUDE.md` , `CONTRIBUTING.md` in Cueserve/cs-cueviksync. Example issue: #41.
